

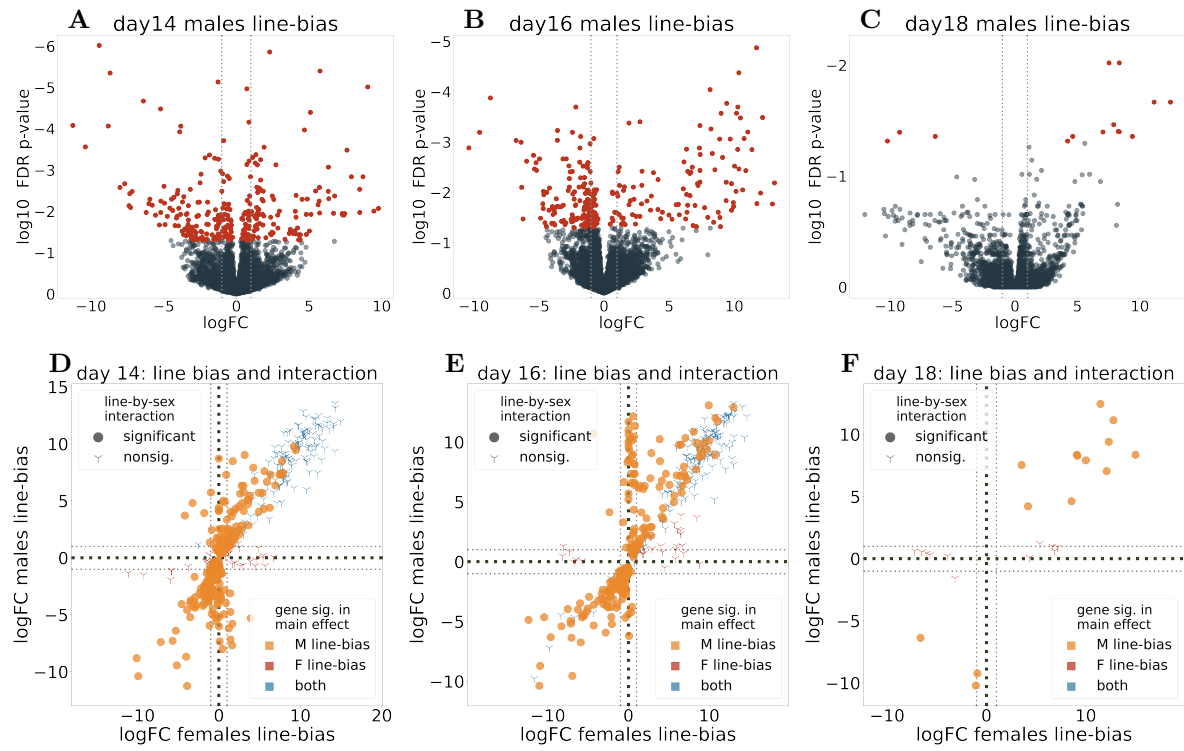

Figure 1: **Line-biased genes in males.** (A, B, C): Genes significantly differentially expressed (red= $\text{FDR-p} < 0.05$) in each developmental timepoint (301 genes in day 14, 281 genes in day 16, 14 genes in day 18). Genes that are also line-biased in females are not shown. All genes are also significant in the line-by-sex interaction. (D, E, F): $\log_2\text{FC}$ of genes that show significant line-bias in male samples, female samples or both.
