

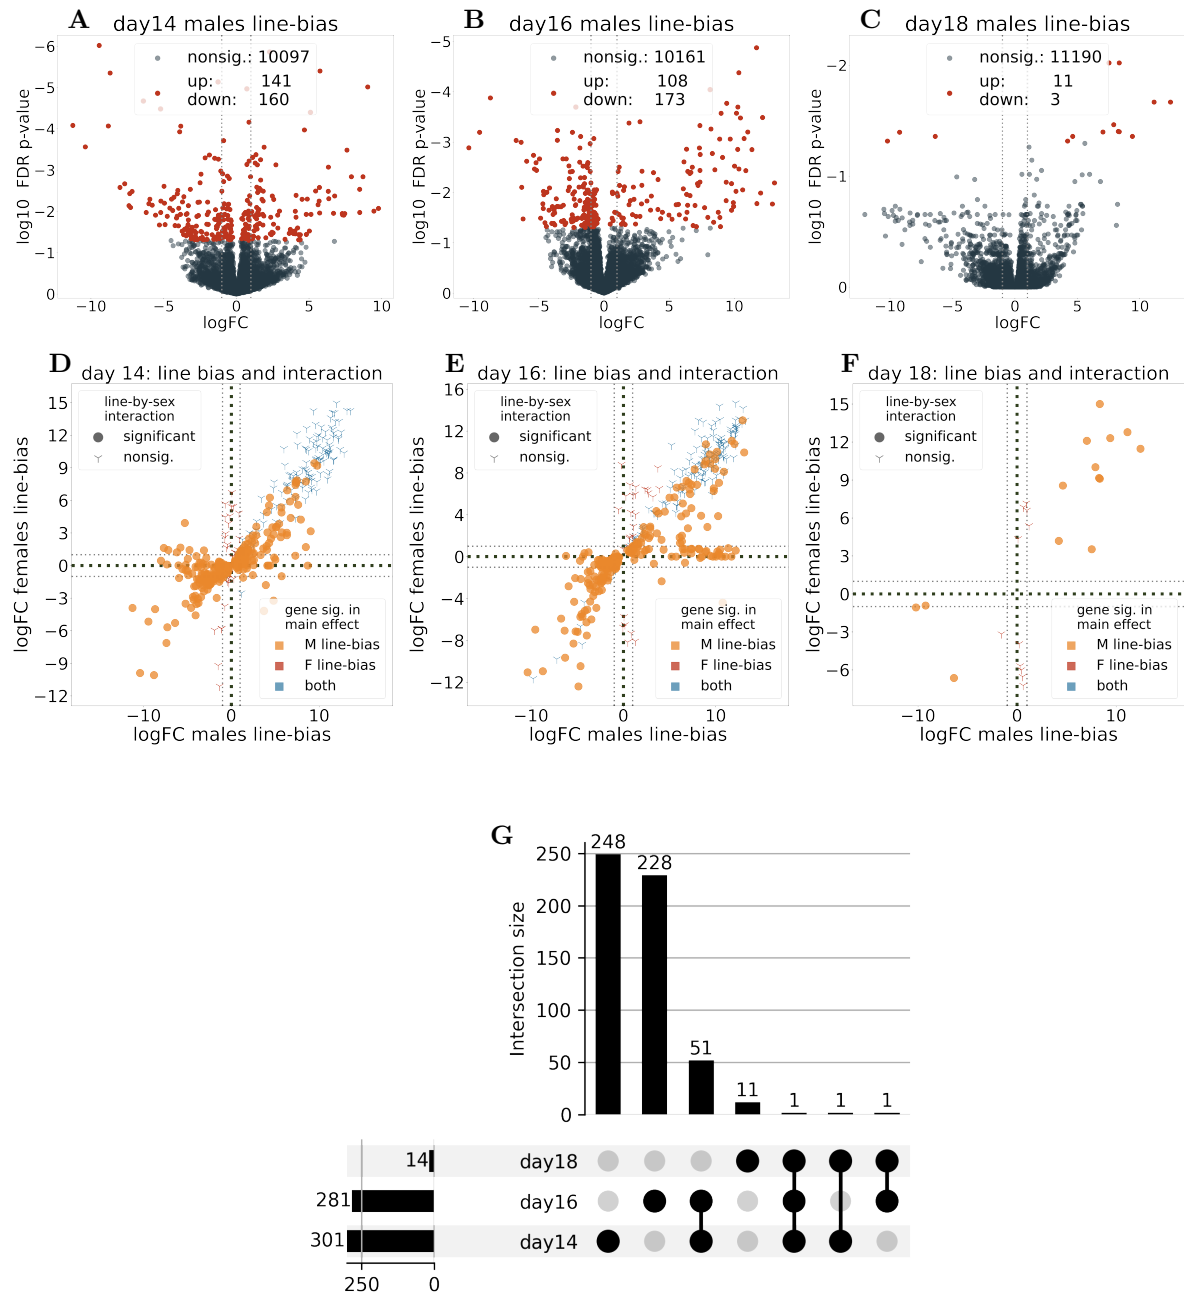

Figure 1: Line-biased genes in males. (A, B, C): Genes significantly differentially expressed in each developmental timepoint (FDR- $p < 0.05$), genes that are line-biased in females are excluded. Figure legend shows numbers of nonsignificant (nonsig.) genes, and genes that are significantly up- or downregulated. (D, E, F): $\log_2\text{FC}$ of genes that show significant line-bias in male samples, female samples or both. All genes that are exclusively male-biased (yellow) are also significant in the line-by-sex interaction. (G): Upsetplot showing the overlap of line-significant genes identified in A-F.
